

# **1 Apache2::Module - Perl API for creating and working with Apache modules**

## 1.1 Synopsis

```

use Apache2::Module ();

#Define a configuration directive
my @directives = (
    {
        name => 'MyDirective',
    }
);

Apache2::Module::add(__PACKAGE__, \@directives);

# iterate over the whole module list
for (my $modp = Apache2::Module::top_module(); $modp; $modp = $modp->next) {
    my $name          = $modp->name;
    my $index         = $modp->module_index;
    my $ap_api_major_version = $modp->ap_api_major_version;
    my $ap_api_minor_version = $modp->ap_api_minor_version;
    my $commands      = $modp->cmds;
}

# find a specific module
my $module = Apache2::Module::find_linked_module('mod_ssl.c');

# remove a specific module
$module->remove_loaded_module();

# access module configuration from a directive
sub MyDirective {
    my ($self, $parms, $args) = @_;
    my $srv_cfg = Apache2::Module::get_config($self, $parms->server);
    [...]
}

# test if an Apache module is loaded
if (Apache2::Module::loaded('mod_ssl.c')) {
    [...]
}

# test if a Perl module is loaded
if (Apache2::Module::loaded('Apache2::Status')) {

    [...]
}

```

## 1.2 Description

`Apache2::Module` provides the Perl API for creating and working with Apache modules

See Apache Server Configuration Customization in Perl.

## 1.3 API

Apache2::Module provides the following functions and/or methods:

### 1.3.1 `add`

Add a module's custom configuration directive to Apache.

```
Apache2::Module::add($package, $cmds);
```

- **arg1: \$package ( string )**  
the package of the module to add
- **arg2: \$cmds ( ARRAY of HASH refs )**  
the list of configuration directives to add
- **ret: no return value**
- **since: 2.0.00**

See also Apache Server Configuration Customization in Perl.

### 1.3.2 `ap_api_major_version`

Get the httpd API version this module was build against, **not** the module's version.

```
$major_version = $module->ap_api_major_version();
```

- **obj: \$module ( Apache2::Module object )**
- **ret: \$major\_version ( integer )**
- **since: 2.0.00**

This methid is used to check that module is compatible with this version of the server before loading it.

### 1.3.3 `ap_api_minor_version`

Get the module API minor version.

```
$minor_version = $module->ap_api_minor_version();
```

- **obj: \$module ( Apache2::Module object )**
- **ret: \$minor\_version ( integer )**
- **since: 2.0.00**

`ap_api_minor_version()` provides API feature milestones.

It's not checked during module init.

### 1.3.4 cmd

Get the Apache2::Command object, describing all of the directives this module defines.

```
$command = $module->cmds();
```

- **obj: \$module (Apache2::Module object)**
- **ret: \$command (Apache2::Command object)**
- **since: 2.0.00**

### 1.3.5 get\_config

Retrieve a module's configuration. Used by configuration directives.

```
$cfg = Apache2::Module::get_config($class, $server, $dir_config);
$cfg = Apache2::Module::get_config($class, $server);
$cfg =      $self->get_config($server, $dir_config);
$cfg =      $self->get_config($server);
```

- **obj: \$module (Apache2::Module object)**
- **arg1: \$class (string)**

The Perl package this configuration is for

- **arg2: \$server (Apache2::ServerRec object)**

The current server, typically `$r->server` or `$parms->server`.

- **opt arg3: \$dir\_config (Apache2::ConfVector object)**

By default, the configuration returned is the server level one. To retrieve the per directory configuration, use `$r->per_dir_config` as a last argument.

- **ret: \$cfg (HASH reference)**

A reference to the hash holding the module configuration data.

- **since: 2.0.00**

See also Apache Server Configuration Customization in Perl.

## 1.3.6 ***find\_linked\_module***

Find a module based on the name of the module

```
$module = Apache2::Module::find_linked_module($name);
```

- **arg1: \$name ( string )**

The name of the module ending in .c

- **ret: \$module ( Apache2::Module object )**

The module object if found, undef otherwise.

- **since: 2.0.00**

For example:

```
my $module = Apache2::Module::find_linked_module('mod_ssl.c');
```

## 1.3.7 ***loaded***

Determine if a certain module is loaded

```
$loaded = Apache2::Module::loaded($module);
```

- **name: \$module ( string )**

The name of the module to search for.

If \$module ends with .c, search all the modules, statically compiled and dynamically loaded.

If \$module ends with .so, search only the dynamically loaded modules.

If \$module doesn't contain a ., search the loaded Perl modules (checks %INC).

- **ret: \$loaded ( boolean )**

Returns true if the module is loaded, false otherwise.

- **since: 2.0.00**

For example, to test if this server supports ssl:

```
if (Apache2::Module::loaded('mod_ssl.c')) {
    [...]
}
```

### 1.3.8 module\_index

To test if this server dynamically loaded mod\_perl:

```
if (Apache2::Module::loaded('mod_perl.so')) {  
    [...]  
}
```

To test if Apache2::Status is loaded:

```
if (Apache2::Module::loaded('Apache2::Status')) {  
    [...]  
}
```

## 1.3.8 **module\_index**

Get the index to this modules structures in config vectors.

```
$index = $module->module_index();
```

- **obj:** \$module (Apache2::Module object)
- **ret:** \$index (integer)
- **since:** 2.0.00

## 1.3.9 **name**

Get the name of the module's .c file

```
$name = $module->name();
```

- **obj:** \$module (Apache2::Module object)
- **ret:** \$name (string)
- **since:** 2.0.00

For example a mod\_perl module, will return: *mod\_perl.c*.

## 1.3.10 **next**

Get the next module in the list, undef if this is the last module in the list.

```
$next_module = $module->next();
```

- **obj:** \$module (Apache2::Module object)
- **ret:** \$next\_module (Apache2::Module object)
- **since:** 2.0.00

### 1.3.11 `remove_loaded_module`

Remove a module from the list of loaded modules permanently.

```
$module->remove_loaded_module();
```

- **obj:** `$module (Apache2::Module object)`
- **ret:** no return value
- **since:** 2.0.00

### 1.3.12 `top_module`

Returns the first module in the module list. Usefull to start a module iteration.

```
$module = Apache2::Module::top_module();
```

- **ret:** `$module (Apache2::Module object)`
- **since:** 2.0.00
